Validation and Filters

Why?

// Use an expression or predicates to validate the content of a message.

// Ensure that messages are valid before attempting to process them

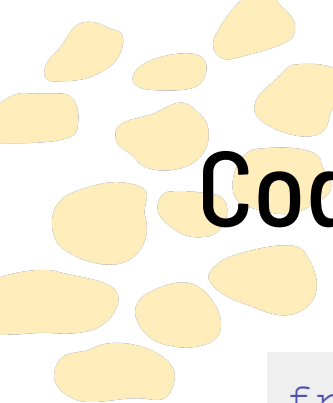

How?

// You can use the validate DSL with all kind of Predicates

**// Validate evaluates the Predicate and if it is false a
PredicateValidationException is thrown.**

// If it is true message processing continues.

Code/Syntax

```
from("...")  
  .validate(bodyAs(String.class).regex("^\\w{10}\\.\\.\\d{2}\\.\\.\\w{24}$"))  
  .to("...");
```

```
from("...")  
  .validate(header("bar").isGreaterThan(100))  
  .to("...");
```

```
from("...")  
  .validate(simple("${in.header.bar} == 100"))  
  .to("...");
```

Validator

// Declarative validation of the message according to the declared Input Type
and/or Output Type

```
validator()  
  .type("csv:CSVOrder")  
  .withExpression(bodyAs(String.class).contains("{name:XOrder}"));
```

Predicate Validator

```
validator()  
  .type("xml")  
  .withUri("validator:xsd/schema.xsd");
```

Endpoint Validator

```
validator()  
  .type("myjava:order2producer")  
  .withJava(Order2ProducerValidator.class);
```

Custom Validator

```
from("direct:validate")  
  .inputTypeWithValidate("myjava:order2producer")
```

Register Validator

Filter

// Filter evaluates a Predicate and if it is false it ignores the message

```
from("...")  
  .filter(header("bar").isGreaterThan(100))  
  .to("...");
```

```
from("...")  
  .filter(simple("${in.header.bar} == 100"))  
  .to("...");
```

Exercise

// best_13_1_filter
